

Natural gas liquefaction project

Customer challenge

A \$14 billion investment over five years to build a natural gas liquefaction facility required a joint venture between two large industrial contractors in Texas. The project owner asked that a contractor controlled insurance program (CCIP) be put in place in order to consolidate all coverages for contractors and subcontractors and reduce the costs of project risks.

The solution

Zurich was selected to provide the CCIP by the joint venture partners because of our ability to provide all the coverages needed on large, complex projects such as this gas liquefaction. Zurich also provided dedicated risk engineers and claims specialists to help manage the potential risks.

Results/benefits

The project is now a year into construction, and moving along without any major losses. The CCIP is saving the owner money on insurance costs, while Zurich's team of risk engineers is helping to manage any unexpected risks for the duration of the project.
